## **Charge It! Math Worksheet Answers**

It is more convenient to write very small and very big numbers in terms of different units. For example, rather than saying 365 days, we say one year. Rather than saying 3,600 seconds, we call it one hour.

To determine the charge on an object when given the number of **excess** electrons or **unbalanced** protons, use the following equations:

charge = # of excess electrons  $\times$  (-1.6  $\times$  10<sup>-19</sup> C/electron)

charge = # of unbalanced protons  $\times$  (1.6  $\times$  10<sup>-19</sup> C/proton)

## Using your calculator, determine the following amounts.

1. What is the charge on an object that has 1,000,000 unbalanced protons?

1,000,000 protons x (1.6 ×10<sup>-19</sup> C/proton) = 0.000000000016 C = 1.6 x  $10^{-13}$  C

2. What is the charge on an object that has 6,000,000 excess electrons?

6,000,000 electrons x (-1.6 ×10<sup>-19</sup> C /electron) = - 0.0000000000096 C = -9.6 x  $10^{-13}$  C

To determine the number of **excess** electrons or **unbalanced** protons when given the charge on an object, use the following equations:

# excess electrons =  $\frac{\text{charge}}{-1.6 \times 10^{-19} \,\text{C/electron}}$ 

# unbalanced protons =  $\frac{\text{charge}}{1.6 \times 10^{-19} \text{ C/ proton}}$ 

3. How many unbalanced protons are there in an object with a charge of  $48 \times 10^{-19}$  C?

 $48 \times 10^{-19} \text{ C} \div (1.6 \times 10^{-19} \text{ C /proton}) = 30 \text{ C unbalanced protons}$ 

4. How many excess electrons are there in an object with a charge of  $-800 \times 10^{-19}$  C?

 $-800 \times 10^{-19} \text{ C} \div (-1.6 \times 10^{-19} \text{ C} / \text{electron}) = 500 \text{ C}$  excess electrons
