# Bernoulli Equation Practice Worksheet Answers 

## Problem 1

Water is flowing in a fire hose with a velocity of $1.0 \mathrm{~m} / \mathrm{s}$ and a pressure of 200000 Pa . At the nozzle the pressure decreases to atmospheric pressure ( 101300 Pa ), there is no change in height. Use the Bernoulli equation to calculate the velocity of the water exiting the nozzle. (Hint: The density of water is $1000 \mathrm{~kg} / \mathrm{m}^{3}$ and gravity $g$ is
 $9.8 \mathrm{~m} / \mathrm{s}^{2}$. Pay attention to units!)]

Answer:

$$
\frac{1}{2} \rho v_{1}^{2}+\rho g h_{1}+P_{1}=\frac{1}{2} \rho v_{2}^{2}+\rho g h_{2}+P_{2}
$$

Since the height does not change $\left(h_{I}=h_{2}\right)$, the height term can be subtracted from both sides.

$$
\frac{1}{2} \rho v_{1}^{2}+P_{1}=\frac{1}{2} \rho v_{2}^{2}+P_{2}
$$

Algebraically rearrange the equation to solve for $v_{2}$, and insert the numbers

$$
\sqrt{\frac{2}{\rho}\left(\frac{1}{2} \rho v_{1}^{2}+P_{1}-P_{2}\right)}=v_{2}=14 \mathrm{~m} / \mathrm{s}
$$

Problem 2
Through a refinery, fuel ethanol is flowing in a pipe at a velocity of $1 \mathrm{~m} / \mathrm{s}$ and a pressure of 101300 Pa . The refinery needs the ethanol to be at a pressure of 2 atm $(202600 \mathrm{~Pa})$ on a lower level. How far must the pipe drop in height in order to achieve this pressure? Assume the velocity does not change. (Hint: Use the Bernoulli equation. The density of ethanol is $789 \mathrm{~kg} / \mathrm{m} 3$ and gravity g is $9.8 \mathrm{~m} / \mathrm{s} 2$. Pay attention to units!)
Answer:

Since the velocity does not change ( $v_{l}=v_{2}$ ), the velocity term can be subtracted from both sides

$$
\rho g h_{1}+P_{1}=\rho g h_{2}+P_{2}
$$

Rearrange algebraically to solve for change in height

$$
\frac{P_{1}-P_{2}}{\rho g}=h_{2}-h_{1}=\Delta h=-13.1 \text { meters }
$$

13.1 meters lower.
