

# Building Our Bridge to Fun!

Civil Engineering in the Classroom

© AP Images

# Main Goals of this Activity

- Learn about how bridges are used and why we need them
- Identify forces acting on a bridge
- Hands-on activity: build two type of bridges (with two type of materials)
- Measure deflection of a span using LEGO ultrasonic sensor
- Gather data (load vs. deflection)

# Introduction

What is a bridge? Why do we need build bridges?

**Water supply**

**Crossing rivers  
or water bodies**

**Traffic**

# Engineering for bridges

## Construction Materials:

- Concrete
- Steel
- Wood
- Stone
- Brick

Bridges are structures to provide passage over water, roadways, and more!

# Engineering for bridges: History

## Primitive People:

- Logs
- Slabs of Rocks
- Intertwined Vines or Ropes

## Roman Empire – First Great Bridge Builders

- Timber Truss Bridges
- Masonry Arch Bridges

## Europeans

- Followed Roman Empire style until iron and steel was used

## Nineteenth Century

- Modern Long Bridges
- Moveable Bridges

# Engineering for bridges: Primitive Bridges

**Rock Bridges**

**Rope Bridges**

**Log Bridges**

# Engineering for bridges: Loads

## Primary Loads acting in a bridge

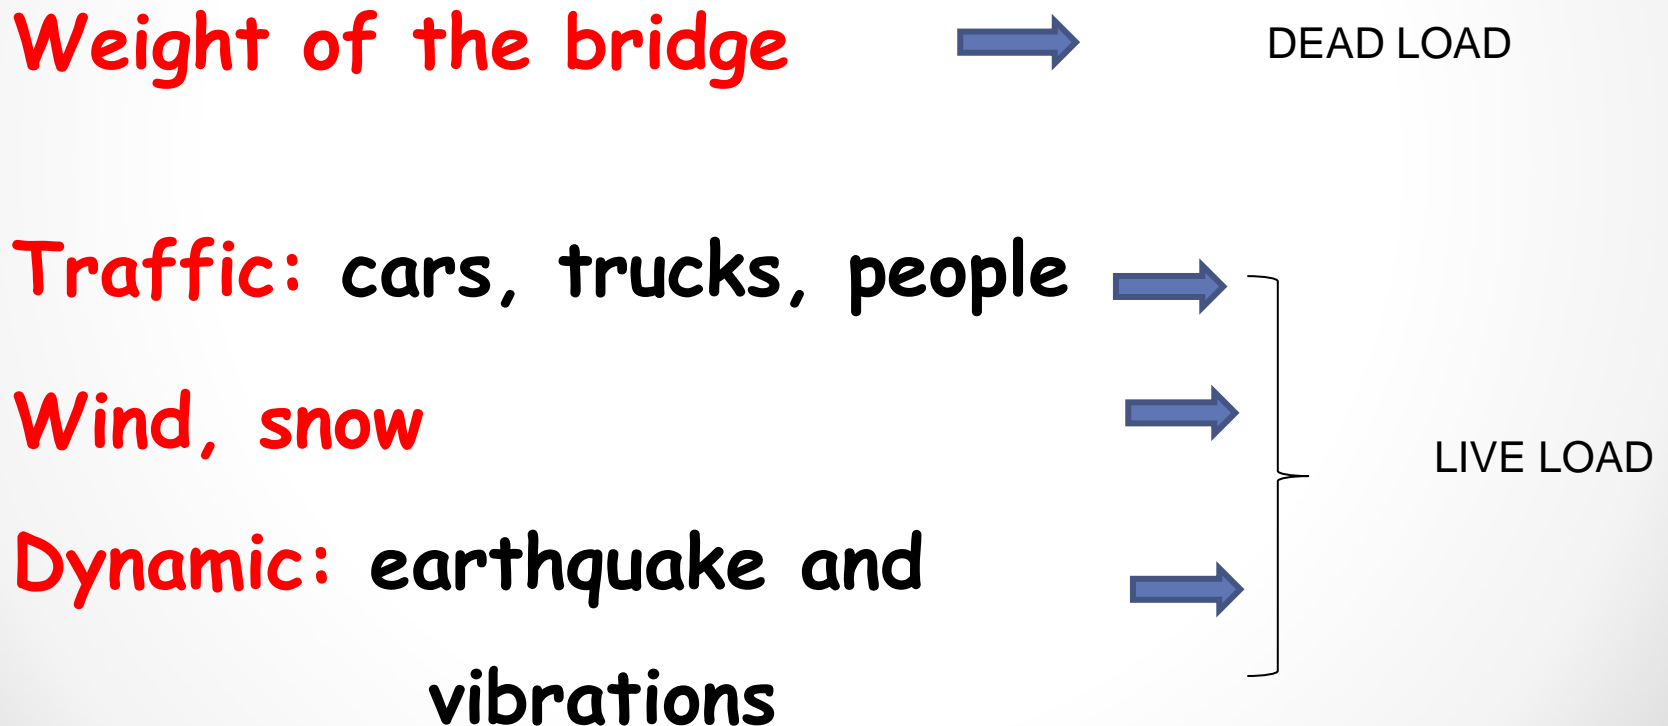

**Weight of the bridge** → DEAD LOAD

**Traffic: cars, trucks, people** →

**Wind, snow** →

**Dynamic: earthquake and vibrations** →

LIVE LOAD

# Engineering for bridges: Primary forces

**Tension:** magnitude of the *pulling* force that acts to *lengthen* an object, usually by a string, cable, or chain.

**Compression:** a *pushing* force that acts to *shorten* the thing that it is acting on. Opposite to tension.

# Engineering for bridges:

## Primary forces

Demo: Use a sponge to represent a beam. When loaded with weight, the divots (holes) on top close and the divots (holes) on bottom open

Conclusion:

The **top** of a beam experiences compression.

The **bottom** of a beam experiences tension.

# Engineering for bridges: Type of Bridges

## Fixed

- Beam bridge
- Truss bridge
- Continuous truss
- Arch bridge
- Cantilever
- Suspension
- Cable-Stayed

## Moveable

- Swing bridge
- Bascule bridge
- Vertical lift bridge

## Other

- Bailey bridge
- Pontoon bridge

# Type of Bridges: Fixed

## Beam Bridges

- Two parallel beams with flooring supported by piers
- Used for highway over and underpasses or small stream crossings

## Truss Bridges

- Beam bridge strengthened by trusses
  - A truss is a structure joined to form triangles with tie rods
- Lighter than ordinary beam sections of equal length
- Useful for longer bridges

# Type of Bridges: Fixed

## Continuous Truss Bridges

## Simple Truss Bridges

# Type of Bridges: Fixed

## Arch Bridges

## Aqueduct

- One or more arches
- Masonry, reinforced concrete or steel
- Roadway on top of arches or suspended by cables
- Spans can be longer than beam or truss

# Type of Bridges: Fixed

## Cantilever Bridges

- Double-ended brackets supporting a center span
- Shore end of each cantilever firmly anchored
- Center supported by pier

## Suspension Bridges

- Roadway hangs from vertical cables supported by overhead cables chained between two or more towers
- Longest spans, costly and challenging to design
- Highly susceptible to winds and swaying
- Cables can be up to three feet in diameter

# Type of Bridges: Fixed

## Cable-Stayed Bridges

- Suspended by cables that run directly down to roadway from central towers
- Less costly than suspension
- Quickly constructible
- Spans must be limited in length

# Type of Bridges: Moveable

## Swing

## Bascule

## Vertical Lift

- Central span turned 90 degrees on pivot pier placed in the middle of the water way

- One or two sections are not supported by piers
- Balanced on one end by counterweights
- Section jack-knives up to allow passage of ships
- Most common type of highway drawbridge

- Central span extends between two towers
- Balanced by counterweights

# Let's start building our bridges:

## Two Designs:

- a. A three-span beam bridge made with paper
- b. A simple truss bridge made of spaghetti (recommended) or any other design is also welcome

# Paper Bridge:

# Spaghetti Bridge:

1. Identify tension and compression forces
2. Learn how to strengthen a single beam bridge
3. Measure deflection using a LEGO MINDSTORMS NXT ultrasonic sensor

# THANK YOU !
