Mindful Messages Worksheet

 intended function. Clarity: The message or signal should be clear and understandable. User-Friendliness: The design should be easy to use and interact with, requiring minimal instructions. Creativity: The solution should be innovative and demonstrate original thinking in addressing the communication problem. Reliability: The prototype should work consistently during tests, without frequent failures. Materials: Any of the provided materials the within your budget. Time: You have hours/minutes to contribute entire project. Budget: You have \$ use on the provided materials. 	lc	Identify the Need/Problem:						
Criteria: Constraints: Constraints: Constraints: Constraints: Constraints: Must use a micro:bit. Materials: Any of the provided materials the within your budget. User-Friendliness: The design should be easy to use and interact with, requiring minimal instructions. Creativity: The solution should be innovative and demonstrate original thinking in addressing the communication problem. Reliability: The prototype should work consistently during tests, without frequent failures. Constraints: Must use a micro:bit. within your budget. Time: You have hours/minutes to conduct the entire project. Budget: You have \$ use on the provided materials.		Identify the Constraints						
 □ Functionality: The communication tool must effectively perform its intended function. □ Clarity: The message or signal should be clear and understandable. □ User-Friendliness: The design should be easy to use and interact with, requiring minimal instructions. □ Creativity: The solution should be innovative and demonstrate original thinking in addressing the communication problem. □ Reliability: The prototype should work consistently during tests, without frequent failures. □ Must use a micro:bit. □ Materials: Any of the provided materials through the		Use the checklist to make sure you follow the criteria and constraints.						
 intended function. Clarity: The message or signal should be clear and understandable. User-Friendliness: The design should be easy to use and interact with, requiring minimal instructions. Creativity: The solution should be innovative and demonstrate original thinking in addressing the communication problem. Reliability: The prototype should work consistently during tests, without frequent failures. Materials: Any of the provided materials the within your budget. 		 intended function. Clarity: The message or signal should be clear and understandable. User-Friendliness: The design should be easy to use and interact with, requiring minimal instructions. Creativity: The solution should be innovative and demonstrate original thinking in addressing the communication problem. Reliability: The prototype should work consistently during tests, without frequent failures. 	 Materials: Any of the provided materials that fit within your budget. Time: You have hours/minutes to complete the entire project. Budget: You have \$ to use on the provided materials. 					

Research the Problem

You may Google or look up background information about your need/problem. You can look up what products or solutions already exist. You can look up what technology is already created that you can modify to fit your needs. You can also research micro:bits and see what code or tutorials are already available. Use this space to keep track of your research.

max of 5.

code, then that needs to be included as well.

Imagine: Develop Possible Solutions		
Brainstorm multiple solutions (at least three) to your problem. You will sketch your ideas and discuss the pros and cons of each solution.		

Name:	Date:	Class:	
	Plan: Select a Promising So	lution	

Revisit your need, constraints, criteria, and research from the earlier steps, compare the best ideas, select ONE solution, and make a plan to move forward with it. Do not forget to write out what supplies and materials you will need to build it. You need to draw a diagram of your prototype and label it with what supplies will be used.

Create: Build a Prototype

Building a prototype makes your ideas real! These early versions of the design solution help your team verify whether the design meets the original challenge objectives. Push yourself for creativity, imagination, and excellence in design. There should be three parts to building the prototype. Check off each one once it is completed.

- □ Construction: Build your prototype using the micro:bit and other materials that you purchased for your design.
- □ Programming: Program the micro:bit to perform the necessary functions for your communication tool.
- Instructions: Create easy-to-understand instructions on how to use your prototype.

N	ame: Date: Class:
	Test and Evaluate Prototype
	Test your prototype to make sure it works and solves the need/problem. Have each person in the group test it and give their feedback on how it went. Talk as a group about what worked, what did not work, and what could be improved. Write your findings here.

Improve: Redesign as Needed		
Make revisions. Draw new designs if needed. Try out other materials if the ones you originally had did not work. You may test and improve as many times as needed or until your time is up. Use the space below to draw or write as needed.
